Clinical data repository

*by*

# Content

## Component services

- openEHR Clinical Data Repository (CDR)
- Virtual folder

## CDR

- Templates - represent distinct clinical data sets. Eg. Vitals, Lab results
- Compositions - Instances of template. Includes real clinical data & context
- Context - provider, practitioner, clinical setting, time etc

## Virtual folder

- Arrange compositions - Visits, problem related
- Create views - Timeline, Problem Oriented Medical Record

# Clinical Data Repository

- Follows openEHR Reference Model
- Template driven data schema
- Runtime schema changes
- Template defined data validation
- Supports multiple coding systems
- Flexible use of text & coded text
- Domain specific complex data types - quality, coded text etc.

## openEHR Templates

- Created offline and ingested into the CDR
- Generic clinical data sets - Vitals, Lab reports, Family history
- Representing UI forms - OP summary, progress report
- Supports context data as per openEHR RM
- Supports queries across templates
- Versioned for CDR schema evolution

# Template examples

Category	Template name
Clinic Visits	<ul style="list-style-type: none"><li>● Progress Note</li><li>● Vital signs</li><li>● Complaints</li><li>● Diagnosis</li></ul>
Prescription	<ul style="list-style-type: none"><li>● Medication order</li><li>● Treatment plan</li></ul>
Test Result	<ul style="list-style-type: none"><li>● Imaging Report</li><li>● Pathology Report</li></ul>
Persistent Lists	<ul style="list-style-type: none"><li>● Adverse Reaction List</li><li>● Family History</li><li>● Medication List</li><li>● Problem List</li></ul>

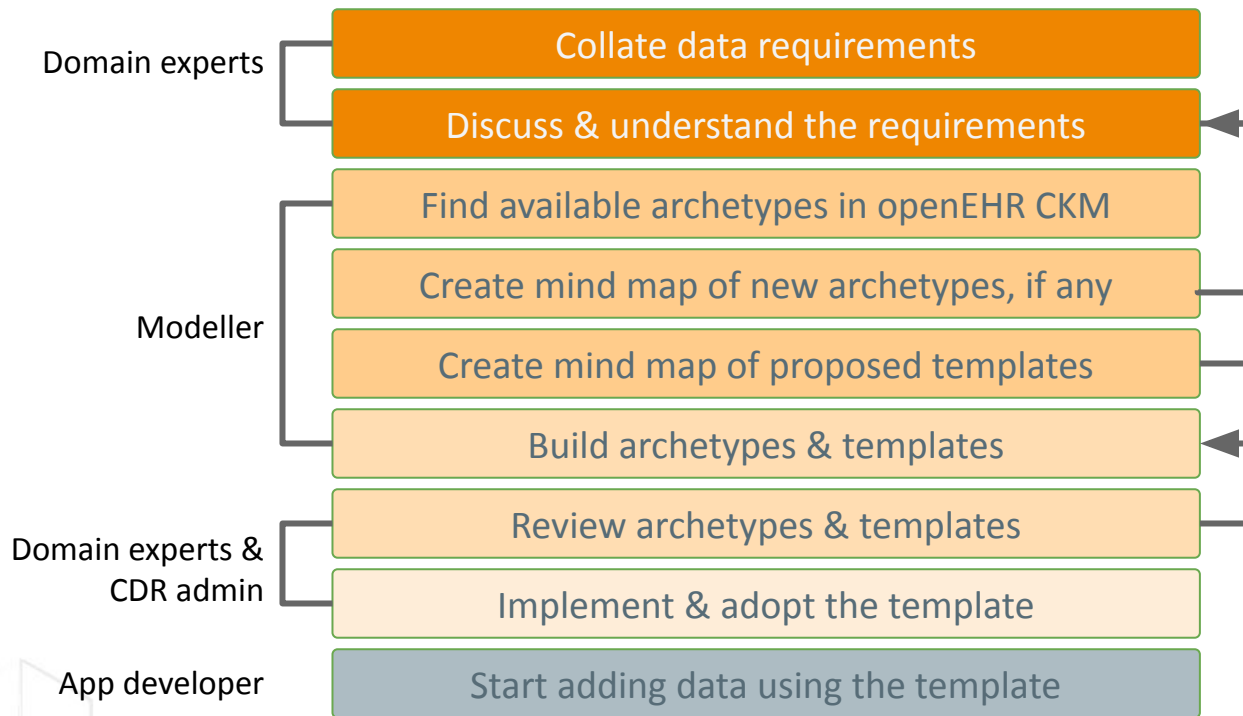

## Clinical data modelling

Identify data requirements and design templates to suit the application

The model-driven openEHR technology ecosystem

# Clinical modelling process

## Compositions

- Instances of templates that store clinical data. They are the units of data
- Represent units of information resulting from a healthcare interaction & Created per patient/person
- Validated against template constraints when created/edited
- Versioned for audit
- Rich context data support - composer, participants, setting, organization, time
- Simplified FLAT JSON format for ease of app development

Learn more - [https://ehrbase.readthedocs.io/en/latest/09\\_flat/index.html](https://ehrbase.readthedocs.io/en/latest/09_flat/index.html)

## Virtual folder

- Flexible folder hierarchies that represent views on clinical data
- Contains only references to compositions
- Multiple folders referencing same compositions
- Views to support app requirements - Longitudinal, problem specific, trends etc.
- Defined and managed by applications
- Folders can contain other folders

## Available APIs

- List available templates in CDR
- Composition CRUD
- Virtual folder CRUD
- Patch APIs for composition references in virtual folders
- Execute predefined queries on clinical data
